

the 1990s, the number of people in the world who are under 15 years of age has increased from 1.1 billion to 1.5 billion, and the number of people aged 65 and over has increased from 0.2 billion to 0.5 billion (United Nations 1999).

There are a number of reasons why the world population is ageing. First, the number of people who survive to old age has increased. This is due to a number of factors, including improved medical care, better nutrition, and a decline in the incidence of infectious diseases. Second, the number of people who are born has decreased. This is due to a number of factors, including a decline in the birth rate, a decline in the number of children who survive to old age, and a decline in the number of people who are born.

The ageing of the world population has a number of implications. First, it will increase the demand for health care and social services. Second, it will increase the demand for housing and transportation. Third, it will increase the demand for retirement income. Fourth, it will increase the demand for long-term care.

There are a number of ways to address the challenges of the ageing world population. First, we can improve medical care and social services. Second, we can improve housing and transportation. Third, we can improve retirement income. Fourth, we can improve long-term care.

The ageing of the world population is a challenge that we must address. We must take action now to ensure that we are prepared for the future. We must ensure that we have the resources and the systems in place to care for the elderly.

The ageing of the world population is a challenge that we must address. We must take action now to ensure that we are prepared for the future. We must ensure that we have the resources and the systems in place to care for the elderly.
